CO₂-avoidance through eco-electricity

Hobart GmbH

Robert-Bosch-Str. 17, 77656 Offenburg

**has opted for eco-electricity NATURpur
from ENTEGA Energie GmbH.**

The expected annual amount of 3.627.000 kWh, corresponding to the power consumption, will be produced from renewable energies and fed into the general power supply grid.

The provided eco-electricity will be produced in Germany in certifiable waterworks and fed directly into the German supply network. The TÜV Rheinland confirms that the energy used in the product „NATURpur Ökostrom-Wasserkraft“ (eco-electricity-water power) is regeneratively produced.

Through their use of ENTEGA eco-electricity NATURpur, the Hobart GmbH annually avoids the emergence of an estimated 540 tons of climate-damaging carbon dioxide gas (CO₂) and thus makes a valuable contribution to climate protection.

The calculation was made on the basis of the fuel mix disclosure as at November 2014.

The contract term for the use of eco-electricity is from 01.01.2016 to 31.12.2018.

Darmstadt, 12.11.2015
